COPYRIGHT STATEMENT

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted materials including foreign works under certain conditions. In addition, the United States extends protection to foreign works by means of various international conventions, bilateral agreements, and proclamations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

The Columbia University Libraries reserve the right to refuse to accept a copying order if, in its judgement, fulfillment of the order would involve violation of the copyright law.

NORTH CAROLINA

COTTON PRODUCTION IN NORTH CAROLINA, 1928-1937

- By Counties -

North Carolina's acreage planted to cotton between 1928 and 1937 ranged from 1,665,000 acres in 1929 to 939,000 acres in 1935. In 1934 980,000 acres were planted, which was the first year since 1900 that the state planted less than a million acres. The drastic reduction in acreages during recent years has been brought about largely by the Agricultural Adjustment Administration and the increased importance of tobacco in this state.

Yield of lint per acre during the 10-year period varied from a low of 213 pounds in 1929 to 336 pounds in 1937. The 1937 yield was the highest on record except 1911. The low yields have been due largely to heavy boll weevil damage, and the high yields to excellent weather conditions favoring plant growth but adverse to weevil activity. The variation in fertilizer application has not affected yields as much as soil leachage and other factors.

Production during the decade shown was highest in 1928 when 832,000 bales were produced and lowest in 1935 when only 572,000 bales were produced. Production is expressed in 500-pound equivalent gross weight bales.

As a general rule, acreage, yield and production in counties varied in relation to changes in the state. Yield per acre, however, tended to vary more in the coastal counties than in the piedmont counties where weevil damage has been less severe.

County production estimates are based upon ginnings as reported by the United States Bureau of the Census, with allowances made for cross-county movements of seed cotton.

The estimates of acreage are based largely upon the state's annual Farm Census or Tax Assessors' Survey. Additional acreage data used included the United States Censuses of 1925, 1930, and 1935, available data from the Agricultural Adjustment Administration for 1933 to 1937 inclusive, and current reports from crop reporters in each year.

Yields per acre are based upon yields derived from the acres and bales reported by the Federal Census in census years, and from current reports from crop reporters in each year.

Frank Parker
Agricultural Statistician
